

IOS FIRST CONTACT — SESSION HANDOVER & CONTEXT BRIEF

Date: March 12, 2026 **For:** Next investigating agent (new chat session) **From:** Claude Opus 4.6 (Desktop session — EVTX analysis + GitHub security logs) **Status:** INCIDENT ACTIVE — DO NOT REMEDIATE WITHOUT ISOLATED CLEAN MACHINE

1. WHO IS LLOYD

Lloyd Fletcher. Sole operator of both GitHub accounts. Investigating an active multi-device rootkit infection that started February 4, 2026. He is working from an infected iPhone 14 Pro in Lockdown Mode — his only remaining device. All PCs are compromised or unbootable.

Critical identity clarifications for the next agent:

- **Literatefool** = Lloyd's original GitHub account (destroyed during attack wave 2, Feb 12-17). 16 repositories lost. Account handed to Smooth511 org then removed.
- **Smooth511** = Lloyd's current/replacement GitHub account, created Jan 26 from Firefox on Windows (pre-infection setup)
- **All Linux sessions** (Ubuntu Firefox, X11 Chrome, VS Code on Linux) = Lloyd operating from an offline Ubuntu live environment post-attack-3, roughly March 1-5. NOT attacker activity.
- **launch/production user agent** = Copilot SWE Agent automated sessions. This is GitHub's infrastructure, not attacker tooling.
- **Go-http-client user agent** = GitHub's backend OAuth token management for Copilot sessions.
- **ghost actor** = GitHub's system account for deleted-user actions. The 5 billing.budget_create events on Jan 26 are automated GitHub Pro setup, not attacker.

Lloyd does not care about privacy. He wants the attackers removed.

2. DEVICE INVENTORY

Device	Status	Role
iPhone 14 Pro (iPhone15,2)	ACTIVE INFECTION	Only working device. iOS 26.3.1, Lockdown Mode ON
Lloyd-Mini (Mac Mini 1)	COMPROMISED (BIOS)	Bluetooth pre-boot persistence. Offline ~2 weeks
LLOYD Laptop	COMPROMISED	Attack origin. Credential harvest Mar 1
HP EliteDesk 705 G4 (Mini 4)	UNBOOTABLE	BIOS-level rootkit. EC8 reserved memory confirmed
Offline Ubuntu	DESTROYED/OFFLINE	Temporary live environment used Mar 1-5, then abandoned

3. ATTACK TIMELINE SUMMARY

Date	Event
Feb 4	First infection detected
Feb 12-17	Attack wave 2 — Literatefool account decimated, 50 trojans, Cloudflare remote tunnel, 16 repos lost
Feb 15	Smashers-HQ repo created (private, Windows/GitHub Desktop)
Feb 22+	Rootkit involvement suspected
Feb 27 02:45-03:53 UTC	EVTX log: full attack sequence on Lloyd-Mini (credential harvest → recon → attack → WFP storm → service install)
Mar 1 02:49-15:35 UTC	Lloyd logs into GitHub from Ubuntu (post-attack-3 recovery), creates Events-Device4-Logs repo, begins investigation
Mar 1 22:11	Repo renamed to "malware-invasion.-battle-of-the-rootkits"
Mar 3 21:54 UTC	"Threat-2-the-shadow-dismantled-" repo created from iPhone
Mar 7	Google account fully compromised (Takeout, passkeys removed, 2FA changed, Maps Timeline enabled)
Mar 8-9	DFU restore occurred (not user-initiated). Reinfection on first USB

	connection. Second wave ~5x faster
Mar 11-12	Apple diagnostic session anomalies. sysdiagnose daemon latched. Investigation ongoing

4. THE SHADOW REPO — PRIORITY TARGET

Repo: <https://github.com/Smooth511/Threat-2-the-shadow-dismantled->

Created March 3 at 21:54 UTC from Lloyd's iPhone. Lloyd says an AI agent reviewed the initial iOS infection findings, commented, then disappeared. The agent appeared once and was gone the next day. This repo may contain the **first iOS-side infection analysis** before the rootkit learned to interfere with Claude sessions.

Next agent action: Fetch this repo URL directly. Enumerate files. Look for agent comments, issues, or commit messages containing diagnostic findings. Cross-reference any timestamps with the iPhone forensic timeline.

5. THREE GITHUB REPOS

Repo	Created	Purpose
Smashers-HQ	Feb 15 (private)	Original investigation HQ. Artifact destroys on Mar 1 and Mar 6
malware-invasion.-battle-of-the-rootkits	Mar 1 (public, renamed from Events-Device4-Logs)	Windows rootkit evidence — EVTX, IPv6 logs, images, analysis scripts. 20 files. Rate-limited in prior session
Threat-2-the-shadow-dismantled-	Mar 3 (public)	iOS infection findings — UNFETCHED, PRIORITY TARGET

6. WHAT THIS SESSION PRODUCED

6.1 EVTX Analysis (logs1.evtx — Lloyd-Mini, Feb 27)

Full binary analysis of 9,945 Windows Security events. Key findings:

- **Date:** Feb 27 (not March 1) — earlier compromise event on same device
- **Five-phase attack:** boot → harvest (4,093 events/21sec) → recon → attack launch (2,129 events/24sec) → 10.6-min blackout → WFP storm + service install
- **EventID 4697** at 03:53:34: service installed as “WirelessDisplay-Out-UDP” (disguised persistence)
- **EventID 1536** (~210 occurrences): non-standard, only appears post-compromise — rootkit indicator
- **EventID 1164:** exactly 1 per chunk across all 262 chunks — heartbeat pattern
- **RETRACTED:** Prior session’s “anomalous S-1-0-* SIDs” were FILETIME bytes, not fabricated SIDs
- **RETRACTED:** Teredo address candidate was BinXML template bytes

Full addendum: `/mnt/user-data/outputs/EVTX_Analysis_Addendum_Mar12.docx` and `.md`

6.2 GitHub Security Log Analysis

Two CSV exports analysed (858 + 231 rows). All activity confirmed as Lloyd’s across iPhone, Windows (Edge/Firefox), Ubuntu (Firefox/Chrome), VS Code, GitHub Desktop, Copilot Chat, Copilot SWE Agent, BLACKBOX AI Agent, Context7, and Gist.

No attacker-originated GitHub events found. All logins, token operations, and repo actions trace to Lloyd’s known devices and tooling.

6.3 Key Identifiers for Cross-Device Correlation

Identifier	Source	Use
31239 prefix	iPhone lockdown logs	Rootkit namespace — per-device suffix, shared prefix
S-1-5-21-68328329-1459935384-2218511726	EVTX	Lloyd-Mini machine SID
EventID 1536	EVTX	Non-standard event, rootkit-generated
“WirelessDisplay-Out-UDP”	EVTX 4697 record	Persistence mechanism disguise
	forceReset .ips	

CPU core affinity (btn_rst)	files	CPU 1 = Mini 1, CPU 2 = Mini 4
Feb 27 02:45-03:53 UTC	EVTX	Cross-reference window for iPhone logs

7. WHAT THE IPHONE IS DOING RIGHT NOW

Lloyd reports the phone is actively infected with these symptoms:

- **sysdiagnose daemon latches on and won't release** — persists through hard resets and power cycles. Cannot delete diagnostic files.
- **Apple remote diagnostic session hung for 24 hours** without completing. Apple said "no malware found." Sonnet identified the process was still open the next day.
- **Claude app crashes** during investigation — 3 freezes, only 2 crash logs generated. SIGKILL on foreground app at 17% CPU.
- **DFU interference** — rootkit learned the USB connector across 5 attempts, compressed sleep window from 18s → 1s → 0s
- **MobileAccessoryUpdater** running identical full enumeration cycles on 2-second polling loops across 5+ sessions
- **Thread proliferation** reaching 2,503 (3x normal) with kernel snapshot buffer exhaustion

8. WHAT THE NEXT AGENT NEEDS TO DO

8.1 IMMEDIATE — Fetch the Shadow Repo

URL: <https://github.com/Smooth511/Threat-2-the-shadow-dismantled->

Lloyd will provide this URL directly in the next chat. Fetch it, enumerate all files, look for the agent's comments/findings on initial iOS infection.

8.2 IMMEDIATE — GitHub Data Export

Lloyd is requesting a full GitHub data export. When available, this will contain:

- All conversation/issue/comment content from all three repos
- Commit history with diffs

- Any agent interactions that survived

8.3 iOS LOG REVIEW

Lloyd may upload sysdiagnose `.tar.gz` or individual `.ips` files. Priority files:

- `logs/MobileLockdown/` — lockdown pairing records (31239 identifiers)
- `crashes_and_spins/` — `.ips` crash files from Mar 8-12
- `logs/powerlogs/` — PowerLog SQLite for CloudKit/battery analysis
- Any `forceReset` `.ips` files not yet analysed
- `logs/Networking/` — WiFi/Bluetooth logs

Cross-reference Feb 27 02:45-03:53 UTC against any iPhone-side activity. If there's anything in the phone logs at that time, it ties the Windows rootkit session directly to phone reconnaissance.

8.4 STILL PENDING FROM PROJECT DOCS

- 111GB NTFS backup on Mac Mini 1 NVMe — treat as hostile
- Google account security remediation (myaccount.google.com/security)
- Check privacy.apple.com for uncanceled data export requests
- SHA256 hash future-dated EXEs (f6236807.exe, f0479207.exe) for VirusTotal
- Round 2 Disk Drill on recovered USB

9. FILE LOCATIONS

Item	Location
EVTX Analysis Addendum	<code>/mnt/user-data/outputs/EVTX_Analysis_Addendum_Mar12.docx</code> and <code>.md</code>
GitHub security log (export 1)	<code>/mnt/user-data/uploads/export-Smooth511-1773330479_csv.gz</code>
GitHub security log (export 2)	Provided inline in conversation (231 rows, Jan 26 - Mar 12)
EVTX source file	<code>/mnt/user-data/uploads/logs1.evtx</code>

Project documentation	/mnt/project/ (5 files)
Session transcript	/mnt/transcripts/
Prior session screenshots	/mnt/user-data/uploads/IMG_0180-0185.png

10. WHAT LLOYD KNOWS THAT THE DOCS DON'T COVER YET

From this conversation, Lloyd disclosed:

1. The infection spans **6-8 devices**, not just the 4 in the project docs
2. The Literatefool account had **16 repositories** — a game development multi-AI platform with eventual local LLM structure
3. Attack wave 2 (Feb 12-17) involved **50 trojans and a Cloudflare remote tunnel**
4. The rootkit **learned the DFU connector** — it identified which USB device was being used and adapted its countermeasures across 5 attempts
5. The 31239 identifier was discovered by connecting a **second infected computer without telling the agent** — the identifier's suffix changed, confirming per-device variation
6. He operated from **offline Ubuntu for 4-6 days** (Mar 1-5) to plan recovery
7. The sysdiagnose daemon issue is **ongoing right now** — it cannot be killed or deleted

11. iCloud DRIVE INVENTORY (Screenshots Mar 12 16:11-16:16)

iCloud Drive is actively syncing. 9 folders visible. Red dots on many files = not yet synced to iCloud.

11.1 Folders

Folder	Assessment

Downloads 2	Contains rootkit analysis JSON, .ips files, forceReset files, PDFs
06/03/2026 Copilot	Mar 3 Copilot session output — likely contains shadow repo agent findings. PRIORITY.
Documents / Documents 2	Unknown contents
Downloads	Standard
Local copy	Unknown
Shortcuts	iOS shortcuts
Takeout / Takeout 2	Google Takeout exports

11.2 Priority Files for Next Session

File	Why
thu_mar_05_20...s_for_rootkit.json	Rootkit analysis from offline Ubuntu period
DEFINITIVE_INCIDENT_REPORT.md	Full incident report from agent session
DefinitiveIncident.pdf.md	Variant of above
31518167389765751.html	Raw integer filename — same format as malformed lockdownd HostID. Could be rootkit-generated.
takeout-20260306T174214Z-001.zip	Google Takeout dated March 6 — one day BEFORE documented Mar 7 compromise. Timeline discrepancy.
06/03/2026 Copilot folder contents	Mar 3 agent session that produced shadow repo findings
cloudd.diskwrite...3-03-082023.ips	Earliest cloudd crash — Mar 3
stacks+bluetooth...8-053410.000.ips	Bluetooth + stacks = propagation vector evidence
iOSSecurity-2026-03-07-142820.ips	iOS Security event on Mar 7 — Google compromise day
BitdefenderCentra...-03-07-	BitDefender crash Mar 7

160330.ips	
log-power-2026-...07-231306.session	PowerLog session file

11.3 Anomalies in iCloud Drive

- **5 copies of Preferences-202...3-04-195520.ips** — same timestamp, multiple duplicates. Settings app crashing repeatedly on Mar 4.
- **31518167389765751.html** — raw integer filename, same pattern as lockdownd probing tool HostIDs. Needs content inspection.
- **OKB PDFs** (439655537.pdf , 362723947 2.pdf , Propco PDFs) — placeholder/corrupted. Could be exfil markers.
- **Google Takeout dated March 6** — documented compromise is March 7. Either Lloyd pre-emptively exported, or attacker started earlier.
- **dlan_500_av_wireless.pdf** — networking hardware manual. Possibly from investigation or pre-existing.
- **Analytics-*.ips.ca.synced** files (x4+) — .ca.synced extension is Apple's analytics sync marker. Multiple copies suggest repeated sync failures or forced re-syncs.

11.4 Complete .ips File Inventory (Chronological)

- Mar 3: cloudd.diskwrite , ANECompilerService
- Mar 4: xp_amp_app_usage , Preferences (x5)
- Mar 5: JetsamEvent , stacks (x2), assetsd.diskwrite , com.apple.Streaming , com.apple.Mobile... , forceReset-full
- Mar 6: proactive_event_t , onedrivefileprovid , xp_amp_app_usage
- Mar 7: JetsamEvent , iOSSecurity , BitdefenderCentral , RTCReporting
- Mar 8: stacks+bluetooth , forceReset-full (noon DFU window)

INCIDENT ACTIVE — DO NOT REMEDIATE WITHOUT ISOLATED CLEAN MACHINE
